

## Problem Statement

You are required to build a social media platform. Your project will consist of two parts.

1. Backend APIs
2. Frontend. You can choose any framework like ReactJS, VueJs or JQuery if you are not familiar with any of these frameworks

## Goals

Your goal is to design a database, all required APIs and frontend for this system. Your designed system should work like this

1. Login Page for user
2. Registration page for user
3. User should be able to follow other users
4. User should be able to search other users and follow them from list
5. Users should be able to create posts (text and image).
6. Posts can be of two types. Public and Private. Public will be visible to anyone on the system and private will be visible to only followers.
7. User should have a profile page where he can update his profile
8. User should be able to see all of his/her followers and followings

Code should be pushed on git with clear instructions to run the code.

In case of any query, send email on [hassan.siddiqui@edly.io](mailto:hassan.siddiqui@edly.io).
